DINYTRACK

Tracking of people and vehicles, information on dwell times in an area, trajectories and journey times.

To obtain behaviour information on people in a particular area, there is the DinyTRACK solution. With these data, it is possible to know the dwell times in an area, the most common routes (various points of the route are defined at which the device must be detected) and the time spent in them. It also displays repetitive users showing how frequently they appear.

With the use of **wireless technologies** (Wi-Fi and Bluetooth signals from mobile devices), the position of the devices is

obtained through triangulation. This leads to the generation of heat maps, and information about frequency and travel times between different points. The platform that receives the information groups the percentage of people passing through into time slots, providing an indicator of the appeal of the route.

Scope of smart destination application

Technology

Solutions for destinations in the following areas

Type of solution
